

Fuel Economizer NANO-PRO

The fuel saver **Nano-Pro** is suitable for large displacement diesel engines (truck, bus, marine, civil works, genset, agricultural machinery,...), compatible with all injection types (common-rail, mechanical injection, direct or indirect injection) naturally-aspirated or turbocharged engine. The bubbler, with a capacity of 3 liters, allows more than 10 hours of water autonomy. The Nano-Pro device is installed externally without any mechanical changes. Its use improves the fuel combustion, therefore reducing the carbon deposits in the combustion chamber and prolongs the life of the engine significantly. For larger engines, more devices have to be installed (see table below, ask your dealer for advice).

HOW IT WORKS

Ambient air (1) is sucked into the bubbler and mixes with water (2) to make humid air (3). This aerosol is transformed by the reactor(s) (4) into a synthetic gas (5) that mixes with air coming from the air filter (6) via the diffuser (7) towards the engine air intake (8) or turbo. Fuel combustion is improved and fuel consumption drops. Cleaner (less polluting) exhaust gases (9) provide the energy necessary for the transformation that occurs in the reactor (4).

APPLICATIONS

Road Vehicles	1 Nano-pro	2 Nano-pro
Consumption (mpg)	12 down to 7	7 down to 2,35
Displacement in liters (Naturally-Aspirated/Turbo)	5 to 10 / 4 to 8	10 to 22 / 8 to 20
Tractors, civil works, marine, genset, industry...		
Consumption (gal/hour)	4 to 8	8 to 16
Power (HP)	110 to 250	250 to 450

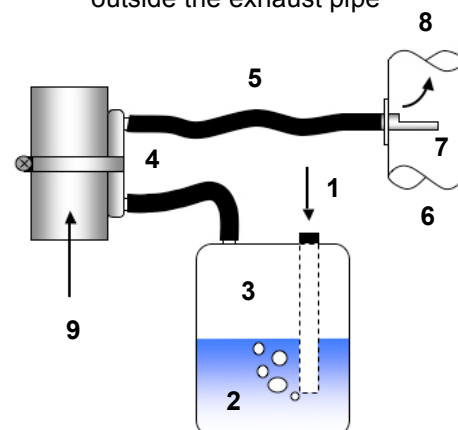

* Depending on operating conditions and characteristics of engine. Your dealer will establish a diagnosis of compatibility of your engine.

Performances

- ✓ 5 to 30% fuel saving*
- ✓ Increases torque
- ✓ Reduces pollution
- ✓ Increases engine's life
- ✓ Quick Installation without modifications
- ✓ Reversible installation
- ✓ Robust for professional use

Reactor Retrokit ® Nano-Pro, installed outside the exhaust pipe
